1 Electric Actuator Controller, DNET115V.

1.1 Introduction

The DNET115V is an actuator control module designed to meet the specific performance requirements of the RCS/ANDCO electric actuators. The module is an integral part of the electric actuator.
The DNET115V provides actuator open/stop/close control, Emergency Shutdown (ESD), end of travel limit switch status, fail to open alarm, and fail to close alarm, via the DeviceNet bus. The module will switch the control power to an electric motor, solenoid, or contactor, by the use of two triacs.
The DNET115V electronic circuitry is powered by the 24 Vdc supply provided by the DeviceNet bus.

1.2 Features

- Open/Stop/Close output control to the actuator
- Open/Close limit switch indication through internally sourced current sensing digital inputs
- Configurable: Drive Open / Drive Closed / Stay-put / Emergency Shut Down commands via the DeviceNet network.
- Failed to achieve Open or Close Alarms
- LED status indicators for local diagnostics
- Configurable address via the DeviceNet network, or on-board DIP switch
- "Plug In" style electrical terminal blocks

1.3 Hardware Specifications

Operating Temperature:	-20 to + 70 C
Storage Temperature:	-40 to + 80 C
Humidity:	90% Non Condensing
Supply Power:	1.5W @ 24Vdc
Solid State Outputs:	(2) Isolated 600VAC 15A
Digital Inputs:	(8) Dry Contacts
Analog Inputs:	(2) Channels (see below)
Processor:	Temic 89C51CC01
RAM:	1K
Flash Memory:	32KB
EEPROM:	32KB
Physical Dimensions:	4.00” x 2.78” x 1.50”
Serial Interfaces:	One CAN 2.0 port.

1.4 Network Communication Protocols

Module supports DeviceNet Group 2 Slave

1.5 Analog Inputs Specification

Resolution:	8bit
Accuracy:	1% of full span (FS).
Linearity:	1% of FS.
Temperature Drift:	2% of FS.
Range:	0 to 5Vdc or 0 to20mAdc input for Analog Input 1 (AI1)

1-5KΩ Potentiometer for the Position Feedback.

1.6 Configuration Switches

1.6.1 Address Switches SW1 and SW2, See Figure 1

Three 16-position DIP switches determines the boards Address and Baud rate:

- MSB selects the high nibble of the Address.
- LSB selects the low nibble of the Address.
- DR selects the Data Rate. 0-125K, 1-250K, 2-500K, 3> - Non Volatile

Note: For DeviceNet, Address values greater than 63 would use address in non-volatile memory.

1.6.2 Calibration Switches, See Figure 1

S1 – Sets the Close Position for RCS Actuators
Sets the Retract Position for Andco Actuators

S2 – Sets the Open Position for RCS Actuators
Sets the Extend Position for Andco Actuator

When the calibration switches are depressed, two of the three Status LEDs will turn ON, indicating that the push button is depressed. After the push button has been depressed for approximately five seconds, the LEDs will return to their previous state indicating that the action has been performed.

1.7 Configuration Jumpers, see Figure 1

JP1 Installed: Connect DeviceNet Shield to Chassis via a High pass filter.
JP2 Installed: Set board in Program Mode
JP2 Not Installed: Normal Operation

1.8 LED Indications, see Figure 1

LED	Description		
M	DeviceNet Module LED: Green		DNET115V module ok
		Red	DNET115V module error
N	DeviceNet Network LED: Green solid		Network communicating with recognized device, network communication O/K
		Green blinking	Network communicating with unrecognized device (Check EDS file)
		Red	No network communication, check network wiring
A	Actuator Status:		
	Red/Green		Actuator Stopped in mid travel.
	Flashing Green		Actuator moving toward full closed (RCS actuators) or retract (Andco actuators) position.
	Solid Green		Actuator at the full closed (RCS actuators) or retract (Andco actuators) position.
	Flashing Red		Actuator moving toward full open (RCS actuators) or extend (Andco actuators) position.
	Solid Red		Actuator at the full open (RCS actuators) or extend (Andco actuators) position
D9	Triac Output Status:	Solid Green	Close/retract command active
		Off	Actuator stopped or no command received over the network
D10	Triac Output Status:	Solid Red	Open/extend command active
		Off	Actuator stopped or no command received over the network

1.8 Terminal Blocks, see Figure 1

1.9 Calibration Procedure

a. Installation Notes

Note 1*:** *The following instructions assume that the DNET115V board is installed in the actuator and all safety, installation and startup instructions outlined in the appropriate RCS and ANDCO actuator installation and instruction manuals have been carried out.* ***Be certain the actuator is in proper operating condition before attempting to calibrate the DNET115V board.

Note 2: *The terms "clockwise" and "counterclockwise" refer to the direction of rotation of the actuator output shaft, for rotary actuators, as viewed from the top of the actuator. For linear actuators, the term "extend", rod moving away from the body of the actuator, and "retract", rod moving into the body of the actuator, refer to the direction of movement of the extension rod.*

b. Potentiometer Calibration

1. Move the actuator to 50% of full travel. Remove the potentiometer slider wire from terminal point 1 on terminal strip J6 and the potentiometer minimum signal wire from terminal point 2 on J6.
2. Using an ohmmeter, measure the resistance between the two wires. The meter reading should be 500 Ohms. If not, loosen the setscrew on the potentiometer pinion gear and adjust the shaft until the reading is 500 Ohms.
3. Tighten the setscrew.
4. Move the actuator to the full closed (RCS actuators) or retract (Andco actuators) position. Use the ohmmeter and measure the resistance between the two wires once again. The reading should be approximately 20 Ohms. Connect the minimum signal wire to terminal point 1 of J6.

   Note: *If the resistance measured at this step is greater than 500 Ohms, the minimum and maximum potentiometer leads are reversed. Remove the remaining potentiometer lead from terminal point 3 of terminal strip J6 and measure the resistance between it and the slider wire. The reading should be approximately 20 to 50 Ohms. Terminate this lead to terminal point 1 of J6. Connect the other lead (not the slider) to terminal point 3 of terminal strip J6.*

5. Move the actuator to the full open (RCS actuators) or extend (Andco actuators) position. Remove the maximum signal potentiometer lead from terminal point 3 of terminal strip J6. Use the ohmmeter and measure the resistance between it and the slider wire. The reading should be approximately 900 to 950 Ohms.
6. Reconnect this lead to terminal point 3 of terminal strip J6.
7. Reconnect the potentiometer slider wire to terminal point 2 of terminal strip J6.

c. Calibrating the DNET115V

1. Electrically, move the actuator toward the full closed (RCS actuators) or retract (Andco actuators) position.

   Note: *If no local pilot devices are available, this may be accomplished by installing a jumper between terminal point 6 and terminal point 4 of terminal block J4. This will run the actuator to the full* closed (RCS actuators) or retract (Andco actuators) position.

   As the actuator is moving the LED's on the DNET115V should give the following indications:
   - M: Solid Green
   - N: Solid Green
   - A: Flashing Green
   - D9: Solid Green
   - D10: Off

   When the end of travel is reached and the limit switch activates, the actuator will stop and the LED's will give the following indications:
   - M: Solid Green
   - N: Solid Green
   - A: Solid Green
   - D9: Solid Green
   - D10: Off

2. Push down and hold S1 on the DNET115V. The LED's will now give the following indications:

   - M: Solid Red
   - N: Solid Red
   - A: Off
   - D9: Solid Green
   - D10: Off

   Hold down S1 (approximately 5 seconds) until the LED's indicate the following:

   - M: Solid Green
   - N: Solid Green
   - A: Solid Green
   - D9: Solid Green
   - D10: Off

   Release S1.

3. Electrically, move the actuator toward the full open (RCS actuators) or extend (Andco actuators) position.

   Note: *If no local pilot devices are available, this may be accomplished by installing a jumper between terminal point 6 and terminal point 3 of terminal block J4. This will run the actuator to the full open (RCS actuators) or extend (Andco actuators) position.*

   As the actuator is moving the LED's on the DNET115V should give the following indications:
   - M: Solid Green
   - N: Solid Green
   - A: Flashing Red
   - D9: Off
   - D10: Red

   When the end of travel is reached and the limit switch activates, the actuator will stop and the LED's will give the following indications:
   - M: Solid Green
   - N: Solid Green
   - A: Solid Red
   - D9: Off
   - D10: Solid Red

4. Push down and hold S2 on the DNET115V. The LED's will now give the following indications:
   - M: Solid Red
   - N: Off
   - A: Solid Red
   - D9: Off
   - D10: Solid Red

   Hold down S1 until the LED's indicate the following:
   - M: Solid Green
   - N: Solid Green
   - A: Solid Red
   - D9: Off
   - D10: Solid Red

   Release S1.

The actuator is now ready for operation over the DeviceNet network. Reinstall the control enclosure, ensuring the gasket (NEMA 4 versions) is properly installed and all retaining bolts are tight.
